Features

The Matrix Orbital Parallel display series offers a low cost display solution utilizing an industry standard communication interface for simple integration into a wide variety of new and existing applications. The Light Emitting Diode backlight with configurable brightness and voltage controlled contrast allows the MOP Liquid Crystal Display line to offer a professional display solution for any project.

Pin	Symbol	Description
8	DB0	Data bit 0
9	DB1	Data bit 1
10	DB2	Data bit 2
11	DB3	Data bit 3
12	DB4	Data bit 4
13	DB5	Data bit 5
14	DB6	Data bit 6
15	DB7	Data bit 7
A	LED (+)	Backlight Anode
K	LED (-)	Backlight Cathode

Instructions

Outline

The MOP-GL12232D is controlled using a standard SED1520 compliant controller. The display is enabled by pulling the Enable (E) pin high, communication to and from the device is controlled by pulling the Read/Write (R/W) line high or low respectively, and the unit may be reset at power up by pulling the reset (RST) line low. Using Register Select (RS), either the data register or command register is selected by toggling RS high or low respectively.

Before any data is read or written, the status of the display controller should be read. This is accomplished by setting RS low, R/W high, E high, and reading the status byte that appears on the data lines. Each bit of the status word indicates a specific condition, outlined below.

Table 3: Status Bits

Bit	Description	Status
D0	Unused.	Unused.
D1	Unused.	Unused.
D2	Unused.	Unused.
D3	Unused.	Unused.
D4	Reset.	0:Normal, 1:Reset.
D5	Display On/Off.	0:Display On, 1:Display Off.
D6	Display Data Direction.	0: Counter-CW, 1: Clockwise.
D7	Busy status.	0:Ready, 1:Busy.

Troubleshooting

Power

For your MOP Display to function correctly, appropriate power must be applied, often as indicated by the backlight illuminating or a darkening of the character spaces. Please refer to the power diagram below and reference all voltages to the specifications provided.

Vdd-V0: LCD Driving Voltage
VR: 10K - 20K

Figure 6: Display with Negative Voltage Output

Vdd-V0: LCD Driving Voltage
VR: 10K - 20K

Figure 7: Display without Negative Voltage Output

Display

If your display is powered successfully, the backlight or contrast should be evident. A lack of text could be the result of a high contrast voltage, lower V_0 .

Communication

When communication of either text or commands is interrupted, check all data and control pins for continuity. Finally, slow down communication and refer to timing diagrams and specifications for proper control flow.

Precautions

- Do not make extra holes in the display, modify its shape, or change the components.
- Avoid applying excessive electrical or mechanical shock to the module.
- Do not drop, bend, twist, or disassemble the display.
- Avoid operation outside absolute maximum ratings.
- Solder only to the I/O terminals provide, ensuring proper grounding.
- Store in an anti-static container within a clean environment, clean carefully if necessary.
